Delete Nodes with Greater on Right

Difficulty: **Easy**Accuracy: **35.51%**Submissions: **158K+**Points: **2**Average Time: **30m**

Given a singly linked list, remove all nodes that have a node with a greater value anywhere to their right in the list. Return the head of the modified linked list.

Examples:

Input: LinkedList = 12->15->10->11->5->6->2->3**Output:** 15->11->6->3

Explanation: Since, 12, 10, 5 and 2 are the elements which have greater elements on the following nodes. So, after deleting them, the linked list would like be 15, 11, 6, 3.

Input: LinkedList = 10->20->30->40->50->60

```
1 class Solution:
2     def reverse(self, head):
3         prev = None
4         curr = head
5
6         while curr:
7             nxt = curr.next
8             curr.next = prev
9             prev = curr
10            curr = nxt
11
12        return prev
13
14    def compute(self, head):
15        # Reverse the linked list
16        head = self.reverse(head)
17
18        max_so_far = head.data
19        curr = head
20
21        while curr and curr.next:
22            if curr.next.data < max_so_far:
23                curr.next = curr.next.next
24            else:
25                curr = curr.next
26                max_so_far = curr.data
27
28        # Reverse again to restore order
29        return self.reverse(head)
```
