Start Timer

Choose and Swap

Difficulty: **Medium**Accuracy: **22.67%**Submissions: **88K+**Points: **4**

Given a string **s** of lowercase English letters, you can swap all occurrences of any two distinct characters **at most** once. Return the **lexicographically** smallest string after this operation.

Examples:

Input: s = "ccad"**Output:** "aacd"

Explanation: In ccad, we choose a and c and after doing the replacement operation once, we get aacd and this is the lexicographically smallest string possible.

Input: s = "abba"**Output:** "abba"

Explanation: In abba, we can get baab after doing the replacement operation once for a and b but that is not lexicographically smaller than abba. So, the answer is abba.

Constraints:

$$1 \leq |s| \leq 10^5$$

```
1 class Solution:
2     def chooseSwap(self, s):
3         chars = set(s)
4
5         for i in range(len(s)):
6             chars.discard(s[i])
7
8             if not chars:
9                 break
10
11             smallest = min(chars)
12
13             if smallest < s[i]:
14                 c1 = s[i]
15                 c2 = smallest
16
17                 res = []
18                 for ch in s:
19                     if ch == c1:
20                         res.append(c2)
21                     elif ch == c2:
22                         res.append(c1)
23                     else:
24                         res.append(ch)
25
26                 return "".join(res)
27
28         return s
```
